

Abstract

5 A deflection device for a motor vehicle window lift comprises a deflection element for deflecting a traction means pertaining to said window lift and spring means for tightening the traction means. The deflection element is moveably mounted on a receiving element and can be placed in a plurality of different positions on the receiving element by the spring means arranged on the receiving element. The receiving element, deflection element and spring means are fixable to the window lift in the form of a pre-mounted module.
